

Ex. No. 1

TEXT ANALYTICS

Basic string creation

```
a <- "hello world"
print(a)
```

String concatenation

```
str1 <- "hello"
str2 <- "how are you?"
print(paste(str1, str2, sep = " "))
```

String formatting

```
result <- format("Hello", width = 8, justify = "l")
print(result)
```

```
result <- format("Hello", width = 8, justify = "r")
print(result)
```

```
result <- format("Hello", width = 10, justify = "c")
print(result)
```

String length

```
len <- nchar("hello world")
print(len)
```

Case conversion

```
upper <- toupper("hello world")
print(upper)
```

```
lower <- tolower("HELLO WORLD")
print(lower)
```

Substring extraction

```
sub <- substring("Programming", 1, 3)
print(sub)
```

Word count

```
text <- "This is simple text analytics in R"
word_count <- length(strsplit(text, " ")[[1]])
print(word_count)
```

Remove numbers from text

```
text3 <- "R programming 123 is easy"
clean_text <- gsub("[0-9]", "", text3)
print(clean_text)
```

Split text into words

```
words <- strsplit("Text analysis using R", " ")  
print(words)
```

Combine words

```
combined <- paste(c("Text", "Mining", "R"), collapse = "-")  
print(combined)
```
